

Task1 Scenario1:

- 1- I used valid email to login to the site to can use Cart and add item to it if you want to change the email

resources/configAmazon.properties - Use the fields 'username' and 'password'

2- Regression Suite Execution Note

The regression suite named "Amazon Regression Suite" is designed to execute all test cases defined within the scenario. By default, it will run all test cases listed in the suite, ensuring comprehensive validation of the application.

If you wish to execute only specific test cases, you can select the desired test cases as needed. This flexibility allows for targeted testing, focusing on particular functionalities or features without executing the entire suite.

Scenario 2:

- 1- In today's deals I can only select one filter category option

["Headphones" OR "grocery"] so I select grocery only in this scenario and comment the code if you want to choose the Headphones.

2-After filtration and got the page of products but I can't find pagination in the page, so I select the product number 30 without going to fourth page.

Task 2

When I Try working on The Task that requires access to the KSRTC website (<https://ksrtc.in/oprs-web/guest/home.do?h=1>). However, I encountered issues as the site appears to be down, preventing me from retrieving the necessary details.

To verify the situation, I employed multiple methods to ensure that the site is indeed non-functional. I tested the website using Postman, accessed it through various web browsers, and even attempted to connect using a VPN. Despite these efforts, the website remains inaccessible.

Additionally, I have a video recording documenting my attempts to access the site, which may provide further insight into the issue.

Further investigation is needed to determine the cause of the downtime.
